

Welcome to the Center for Implant Dentistry

Dr. Sambhav Jain and associates at the Center for Implant Dentistry offer dental patients real solutions they can rely on. At our conveniently located office in the Bay Area in Fremont, CA, we provide a full range of services aimed toward giving you the best options for restoring your smile.

Implant dentistry is considered by many dentists to be one of the most revolutionary developments of modern dentistry. Tooth loss is no longer a permanent problem with only temporary solutions — instead, dental implants provide a permanent solution to an age-old problem.

What is a dental implant?

A dental implant is a dental restoration that uniquely mimics a natural tooth's structure by replacing missing teeth with more than just a crown. The implant is generally composed of three parts:

- The implant post – which is surgically placed and allowed to naturally fuse with the jawbone to function like a root
- The abutment – which is usually placed on the end of the implant post
- The restoration – which is the final tooth (crown) or set of teeth that will be attached to the abutment

These parts work together to create a permanent, stable restoration for dental patients who have lost some or all of their natural teeth.

What are the unique benefits of implants?

Dental implants have become incredibly popular mainly because of their many benefits. Compared to other restorative options like dentures and dental bridges, implants are permanent, and you will not need to damage existing teeth to place them. Because of their unique structure, dental implants can actually improve the health of your mouth by providing the necessary parts to keep your jawbone from deteriorating and causing other teeth to shift. This also benefits your entire facial structure as the bone loss that often follows tooth loss can add years to your face. With dental implants, your smile and your face can stay naturally youthful.

Implants are also as simple to clean as your natural teeth, making your regular dental hygiene habits easier to maintain, which will benefit the overall health of your smile. In addition, because they are permanently anchored in your jaw, implants are stable, so your mouth will not have to adjust to a new way of eating or speaking as it would with traditional dentures, and the implants will not shift in place or need to be removed. Essentially, dental implants are the restoration that will bring you the closest to all the benefits of having your natural teeth back. In time, you may even forget you ever lost your teeth.

Can anyone get implants?

Center For Implant Dentistry

Prestige Dental Group

With many recent advances in implant dentistry, it is now possible for nearly anyone to get dental implants. Whether you have lost one tooth or you have lost all of your teeth, dental implants can help restore your smile to the way it used to be. In some cases, someone with substantial bone loss or certain medical complications may not be a candidate for dental implants. However, with the use of bone grafts, many more patients are now able to enjoy implants even if they have bone loss.

Chances are if you have lost teeth and wish you could have them back, you can enjoy all the benefits of getting the next best thing: dental implants. An implant dentist at our office can work with you individually to find out if implants are suitable for you and find a way to make them work with your unique smile.

The process of fitting a smile with dental implants involves a few different steps, and this is where our office offers an advantage by specializing in implantology. Our office provides all the best technology necessary to guide you through each stage of receiving an implant quickly and successfully under one roof.

Imaging Center

Step 1 of receiving dental implants involves extensive imaging of the current state of your teeth, bones, and the soft tissues in your mouth. This is why our office uses a state-of-the-art CT scan that can create accurate three-dimensional images of your smile to help the dentist map out your treatment plan.

Dental Implant Center

Our three specially trained implantologists make it possible for the implant process to be as quick and painless as possible. Often, what would take other surgeons multiple appointments to accomplish we can wrap up in one visit due to extensive pre-planning. We can usually perform an extraction, place an implant, and even set a restoration on the same day.

CAD/CAM Milling Center

Finally, by using Dr. Jain's own special instruments, we can craft your final restoration right here in the office. This means we have full control over the choice of materials and the customization of your restoration so that it can be perfectly matched to your desires.
